App Requirements for Part 2

This task involves developing a **budget tracker app** with a focus on functionality, data persistence, and a user-friendly interface. Below is the detailed breakdown of how to implement the requirements:

- The user must be able to **log in** to the app using a username and password.
- The user must be able to create **categories** that the expense and budget entries will belong to.
- The user must be able to **create an expense entry**, specifying at least the date, start and end times, description, and category.
- The user must be able to optionally add a **photograph** to each expense entry.
- The user must be able to set a **minimum** monthly goal for money spent, as well as a **maximum** goal.
- The user must be able to view the **list** of all the expense entries created during a **user-selectable period**. If a **photo** was stored for an entry, the user must be able to **access** it from this list.
- The user must be able to view the **total amount** of money spent on each **category** during a **user-selectable period**.
- All data should be saved to a local SQLite, RoomDB or similar offline Android database platform.

Budget Progress when Expenses are made for the month

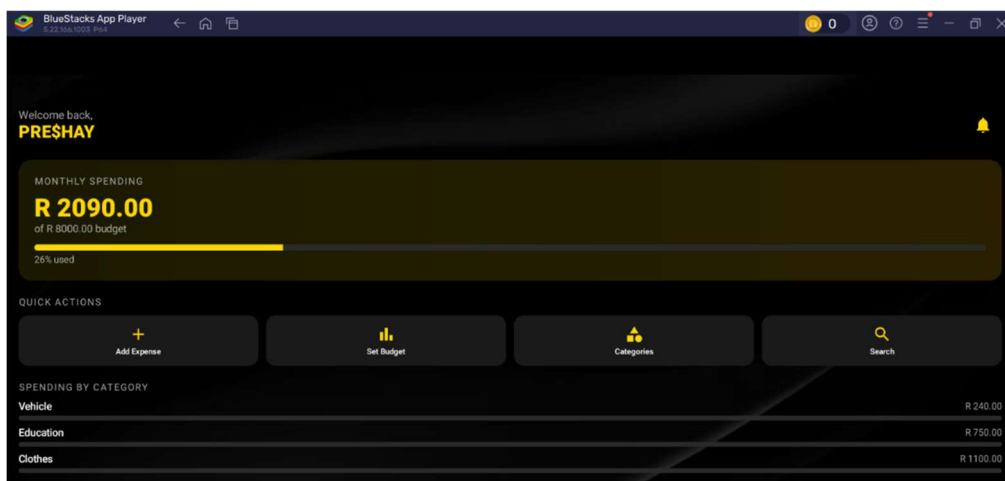

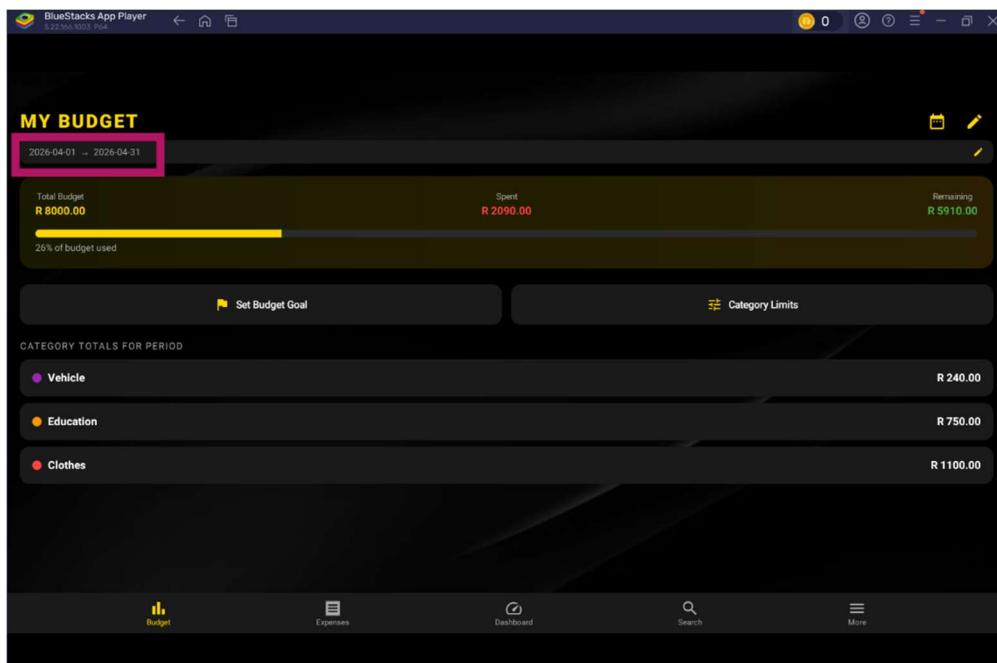

Expense Entries filtered by Dates

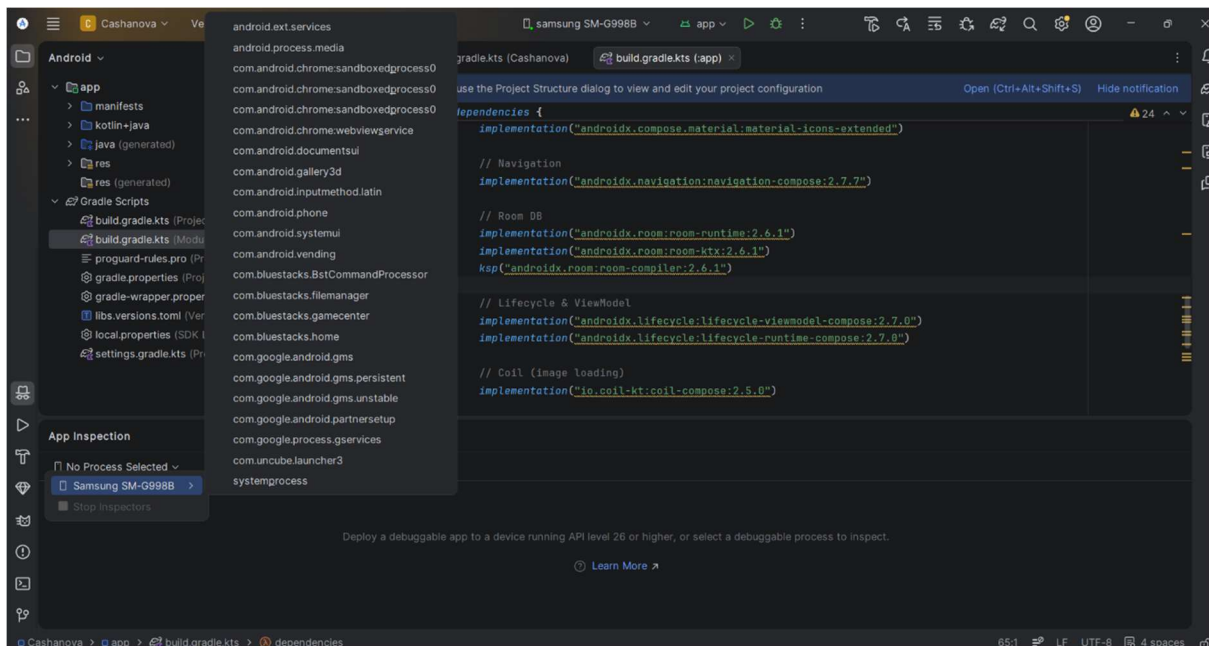

The expense page supports filtering by date range. Screenshot 1 displays results for the entire month of April. Screenshot 2 shows the result when no expenses exist for the selected range.

Total Spent for each Category

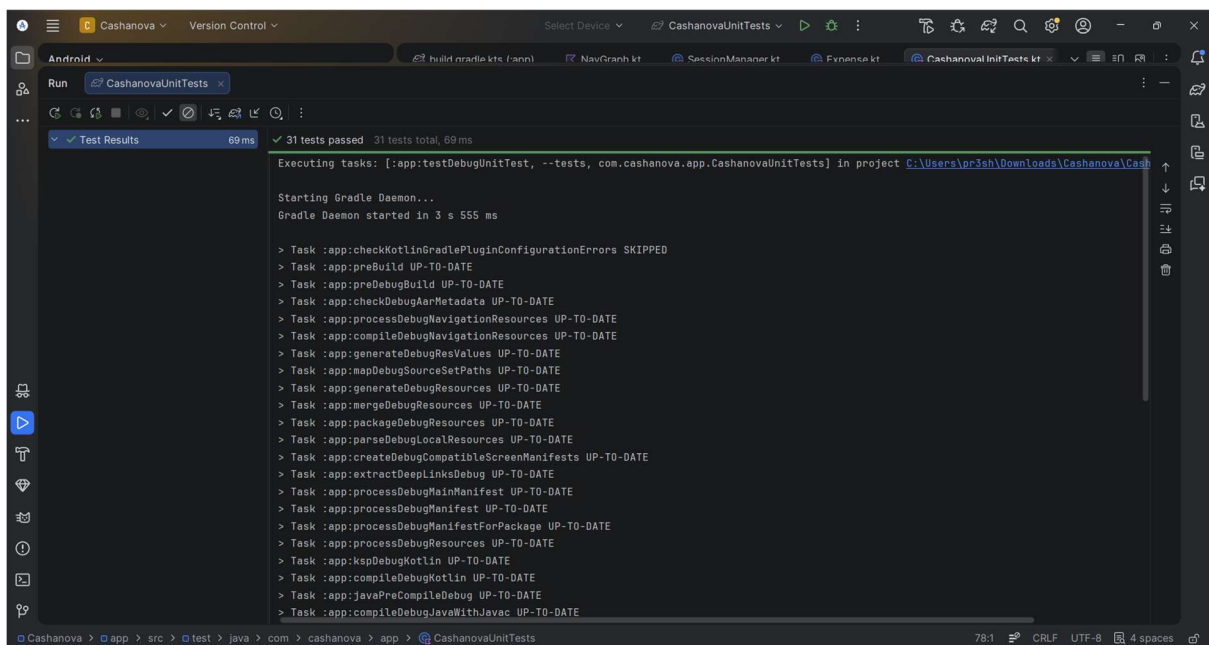

The total money spent for each category can be filtered by date range. The pink highlighted box in screenshot 1 displays the date range, so within that specific date range, the total spent for each category will be shown. Screenshot 2 shows the total spent for each category on the dashboard as a quick way to view it.

RoomDB Implementation and App Inspection

This screenshot shows the code of the RoomDB implemented. The app inspection shows all the processes that happened in the app paired together with RoomDB.

Unit Tests Passing
